Database: MongoDB, MySQL

You can choose any of the combination from the above.

Prizes

Overall 1st: To be announced later

Overall 2nd: To be announced later

1st Year Reserved: To be announced later

Problem Statement

In our institute every year we offer winter hoddies for our students. Your task is to create a cart system so that our student can have their buying process comfortable. Project has to satisfy following minimum requirements.

- *It should have provision to take current student details.*
- *Each item should be displayed along with its colour and size options.*
- *Once item is selected it must be added to cart.*
- *User can view cart anytime with provision to remove item or modify size and quantity.*
- *Once order is placed cart should be empty again.*
- *Here placing order will means printing a cash memo of the items purchased with relevant details in pdf form which can be downloaded by the user.*
- *You also had to store details of every order placed and even record of incomplete orders.*
- *Make sure it is user-friendly and responsive.*
